Section 9

Index Algorithm and Calculation Method

9.0 Index Algorithm and Calculation Method

9.1 Prices

9.1.1 FTSE Russell may remove a security from the FTSE Russia Unclassified Index Series should it consider that 'accurate and reliable' prices are not available.

9.1.2 The FTSE Russia Unclassified Index Series uses the last trade prices for securities with local bourse quotation for the end-of-day index calculation.

9.2 Algorithm

9.2.1 The FTSE Russia Unclassified Index Series is calculated using the chained Paasche methodology.

9.2.2 The performance of the FTSE Russia Unclassified Index Series on any given day is determined by calculating the percentage difference between:

- the index's market capitalisation as at the close of that day and
- the market capitalisation at the start of that day.

'Start of the day' is defined as the previous day's close adjusted for capital changes, free float weighting changes, additions and deletions, etc.

9.2.3 Adjustments apply whenever capital changes take place, so that the performance of the FTSE Russia Unclassified Index Series reflects the experience of investors.

9.2.4 The FTSE Russia Unclassified Index Series are calculated using the following formula:

$$\sum_{i=1}^N \frac{(p_i \times e_i \times s_i \times f_i \times c_i)}{d}$$

Where,

- $i=1,2,\dots,N$
- N is the number of securities in the index.
- p_i is the latest trade price of the component security (or the price at the close of the index on the previous day).
- e_i is the exchange rate required to convert the security's currency into the index's base currency.
- s_i is the number of shares in issue used by FTSE Russell for the security, as defined in these Ground Rules.

- f_i is the Investability Weighting Factor to be applied to a security to allow amendments to its weighting, expressed as a number between 0 and 1, where 1 represents a 100% free float. This factor is published by FTSE Russell for each security in the underlying index.
- c_i is the Capping Factor to be applied to a security to correctly weight that security in the index. This factor maps the investable market capitalisation of each stock to a notional market capitalisation for inclusion in the index.
- d is the divisor, a figure that represents the total issued share capital of the index at the base date. The divisor can be adjusted to allow changes in the issued share capital of individual securities to be made without distorting the index.
